The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gage et al, WO 0055150, cited by applicants in view of Holz et al cited by applicants. The former discloses the same asymmetric hydrogenation using the corresponding bis-(dimethyl-phospholane) benzene catalyst, commonly termed Me-DuPHOS. See Ex. 17 wherein [(1,5-cyclooctadiene)rhodium(I)-1,2-bis-(2R,5R)-dimethyl-phospholano)benzene]tetrafluoroborate the chemical name of Me-DuPHOS is given. Note that the 3alpha(R) enantiomer is stereoselectively produced.

If it could be shown that the instantly used bis-(dimethyl-phospholane) maleic anhydride catalyst, termed MalPHOS, is considered to be superior to the above catalyst for asymmetric hydrogenations of similar compounds, then one of ordinary skill would have been motivated to substitute same for the former catalyst and to perform the instant conversion and thus it would have been obvious to one of ordinary skill in the art.

This is shown by Holz et al which states in the Abstract that "both complexes have been tested is the asymmetric hydrogenation of unsaturated alpha- and beta-amino acid precursors of pharmaceutical relevance. In several cases, the new catalyst was superior in comparison to the Me-DuPHOS complex, in particular when (Z)-configured beta-acylamido acrylates were used as substrates."
